

Let me cut it to you straight... The world is running out of water, and lately it's been getting worse. In this essay I'm talking about the United States... Stay tuned and help the world.

It is known by some that climate change is a thing but if you don't either you are living under a rock or you just don't know, in either case here it is. Climate change is a problem due to air pollution and the greenhouse effect kicking in. Have the fact in mind this is what makes Venus, the second planet in the Solar System, the hottest. In the case of Venus, thick clouds of carbon dioxide make a blanket around the planet. Earth could end up the same.

Factories around the USA are responsible for this. The factories rely on coal and gas which burn and in-turn release carbon dioxide. See where i'm going with this? If factories continue to use coal and gas as energy, Earth could become the next Venus.

If you're fact checking this you'll see the Earth becoming the next Venus, is a little ways away. However that doesn't mean we're in the green. As the planet heats up, glaciers melt and fresh water evaporates. If the glaciers melt, arctic animals will die and if fresh water evaporates, we will die. Droughts will happen frequently and nature will start to fade.

Thanks for listening, to some this may not have been easy but, thank you, and g'bye.
